

RETAIL OUTLET INTEGRITY FOR FUEL RETAIL

FuelLedger

Every litre, accounted for.

● PILOT-READY

FuelLedger reconciles each fuel station four ways: what the depot invoiced, what reached the tanks, what the nozzles sold and what money was received. Any gap between these steps is flagged with its value and the action to take on site.

Capabilities

Four-way reconciliation Delivery, stock and payment gaps for every outlet, every day.

Fuel quality protection Density monitoring to flag possible adulteration.

Leak and dispenser checks Night-time level drops, tank leaks and nozzle short-dispensing.

Transporter scorecards Detects transit theft patterns that span many outlets.

Payments and fleet cards Cash deposit shortfalls and fleet card misuse.

How it works

1. Invoiced. What the depot dispatched and billed.
2. Received. What actually reached the outlet's tanks.
3. Sold. What the nozzles dispensed.
4. Collected. What money and card payments were received.

Built for

Oil marketing companies, Fuel retail networks, Fleet operators.

Data we'll need for a pilot

- Depot dispatch and invoice records
- Tank level (ATG) and density readings
- Nozzle or dispenser sales
- Cash deposit and fleet card records

How we work

- Learns from your own data and explains every flag it raises.
- Runs in your environment or a cloud account you approve.
- Humans stay in charge: borderline cases go to review, every decision is logged.
- Versioned models with monitoring, retraining and rollback.

Pilot program

6-8 weeks on your own historical data, in shadow mode with no impact on live systems. Success criteria are agreed upfront and you get a clear go or no-go at the end. Fixed fee, credited in full against year one if you roll out.
