

ENERGY THEFT AND LOSS ANALYTICS FOR POWER DISTRIBUTION

GridSentinel

Find where energy goes missing.

● PILOT-READY

GridSentinel turns smart meter data into an inspection-ready list of suspected theft and losses. It balances the energy received at every distribution transformer against what its consumers were billed, then ranks consumers by expected recovery so field teams go where it matters most.

Capabilities

Transformer energy balance	Pinpoints the transformers and areas with unexplained loss.
Covers every loss type	Meter bypass, tampering, hooking, category misuse, overloading, billing irregularities and net-metering misreporting.
Fewer false alarms	Separates theft from faulty meters, communication gaps and vacant premises.
Explainable leads	Every flag comes with reasons and a recommended field action.
Closed loop	Inspection results feed back to improve the model over time.

How it works

1. Balance. Energy in at each transformer is compared with energy billed to its consumers.
2. Locate. Transformers and areas with unexplained loss are ranked.
3. Explain. Suspect consumers are listed with reasons, separating theft from meter or data faults.
4. Inspect and learn. Field teams act on ranked leads; their findings retrain the model.

Built for

Electricity distribution companies (DISCOMs), Smart metering programmes.

Data we'll need for a pilot

- 12+ months of smart meter readings
- Transformer-level energy input
- Consumer master and billing records
- Past inspection outcomes, if available

How we work

- Learns from your own data and explains every flag it raises.
- Runs in your environment or a cloud account you approve.
- Humans stay in charge: borderline cases go to review, every decision is logged.
- Versioned models with monitoring, retraining and rollback.

Pilot program

6-8 weeks on your own historical data, in shadow mode with no impact on live systems. Success criteria are agreed upfront and you get a clear go or no-go at the end. Fixed fee, credited in full against year one if you roll out.
