

REAL-TIME PAYMENT FRAUD DETECTION

PaySentinel

Stop fraud before the money moves.

PaySentinel scores every payment transaction in real time and flags likely fraud before it is approved. Built for payment gateways, aggregators and fintechs, it learns from your own transaction history: device behaviour, merchant risk, transaction timing and amount patterns.

Capabilities

Real-time risk scoring	Every transaction gets a fraud score and an approve, review or decline decision.
Behavioural signals	Device velocity, unusual amounts, high-risk merchant categories and late-night patterns.
Built-in drift monitoring	Tracks data, score and performance drift, and tells you when to retrain or roll back.
Production-ready safeguards	Schema validation, training-serving consistency checks and versioned models with rollback.

How it works

1. Connect. Transactions stream in from your gateway or switch.
2. Score. Each one is scored against patterns learned from your own history.
3. Decide. An approve, review or decline decision comes back before authorisation.
4. Monitor. Drift and performance are tracked, with clear signals to retrain or roll back.

Built for

Payment gateways, Payment aggregators, Fintechs, Banks.

Data we'll need for a pilot

- 12-24 months of transaction records
- Fraud and chargeback outcomes
- Device, merchant, amount and timestamp fields
- Current rules or decisions, for comparison

How we work

- Learns from your own data and explains every flag it raises.
- Runs in your environment or a cloud account you approve.
- Humans stay in charge: borderline cases go to review, every decision is logged.
- Versioned models with monitoring, retraining and rollback.

Pilot program

6-8 weeks on your own historical data, in shadow mode with no impact on live systems. Success criteria are agreed upfront and you get a clear go or no-go at the end. Fixed fee, credited in full against year one if you roll out.
